No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                     Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with reduced bilirubin glucuronidation capacity. Analysis of the genetic basis of GS has allowed 2 forms to be identified. One is a mild form associated with a homozygous 2 bp insertion in the TNTA sequence upstream of the UGTI*1 exon 1, and the other is a more severe form associated with heterozygosity for a mutation which, when homozygous, causes Crigar-Najjar type 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from GS, which is benign, may have altered metabolism of some drugs, making it difficult to determine if an effect is due to the drug or the syndrome. Drug trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on basis of them possessing.

capacity. Analysis of the genetic basis of GS has allowed 2 forms to be capacity. Analysis of the genetic basis of GS has allowed 2 forms to be dentified. One is a mild form associated with a homozygous 2 bp insertion in the TATA sequence upstream of the UGT1*1 exon 1, and the other is a more severe form associated with heterozygosity for a mutation which, when homozygous, causes Crigler-Najjar type 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from GS, which is benign, may have altered metabolism of some drugs, making it difficult to determine if an effect is due to the drug or the syndrome. Drug trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on basis of them possessing or not possessing GS. In this case, screening involves PCR amplification of the UGT gene, using the primers described in AAT79541-44.
                                                                                                                                                                                                                 This sequence represents the upstream sequence, positions -611 to 9 in the patent, of uridine diphosphate glucuronosyltransferase (UGT) gene 1*1 exon 1. This gene is known to be associated with filbert's syndrome (GS). GS is a mild, common form of unconjugated syndrome (GS). GS is a mild, common form of unconjugated by the syndrome (GS).
                                                                                                                                                                                                                                                                                                                                   Improving drug trial efficiency comprises identifying participants with Gilbert's syndrome - useful as their altered drug metabolism may hinder result interpretation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDS

Six unique N-termini of 286-289 amino acids are encoded by
six different first exons and identical C-termini of 246 amino
acids are encoded by the common exons 3-5. The UGT1 gene locus
encodes a family of UDP-glucuronosyl transferase isozymes, two of
which metabolise bilirubin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAQ33024 standard; DNA; 1167

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ន្តន្តន
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAZ45058/c
cc alcohols, amines and fatty acids. Many of the reactions catalysed by CC UGTs result in toxic substances being converted to compounds which are come water soluble and are excreted. The invention relates to and identifies UGT1 polymorphisms (ARAZ5004-Z45041). The polymorphisms CC sequences are useful as probes for detecting UGT1 locus polymorphisms, CC indicative of altered UGT1 expression or activity. These polymorphisms CC indicative of altered UGT1 expression or activity. These polymorphisms CC are associated with CT19ler-Nejjar and Gilbert syndromes (unconjugated CC hyperbilirubinaemia) and drug metabolism. The genotyping of the UGT1 gene CC is used to predict the rate of metabolism of UGT1 substrates, possible CC dosage), and to screen for diseases caused by exposure to toxins and to sequences, including polymorphisms, can also be used to produce the CC corresponding protein/corits fragments) or to generate transgenic corresponding protein/corits fragments) or to generate transgenic collaborations of modified cells e.g. for pharmacogenetic screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

Forward PCR primer for sequencing UGT1 exon 1A polymorphism #1

Uridine diphosphate-glucuronosyltransferase 1; UGT1; polymorphism; probe; glucuronic acid: Crigler-Najjar syndrome; Gilbert syndrome; Jaundice; unconjugated hyperblirubinaemia; drug metabolism; transgenic animal; screening; diagnose; PCR primer; ss.

New nucleic acid representing polymorphisms in the human uridine diphosphate glucuronosyltransferase gane, used for diagnosis and evaluation of drug metabolism

Examples; Page 19; 63pp; English.

The polymorphisms sequences are useful as probes for detecting UGT1 locus polymorphisms, indicative of altered UGT1 expression or activity. These polymorphisms are associated with Crigler-Najdar and Gilbert syndromes (unconjugated hyperbilirubinaemia) and drug metabolism. The genotyping of the UGT1 gene is used to predict the rate of metabolism of UGT1 substrates, possible drug-drug interactions and adverse side effects (i.e. to optimize drug dosage), and to screen for diseases caused by exposure to toxins and to study the effects of polymorphisms on enzymatic activity. The UGT1 sequences, including polymorphisms, can also be used to produce the corresponding protein (or its fragments) or to generate transgenic animals or modified cells e.g. for pharmacogenetic Primers AAZ45074-Z45109 are used to sequence the human uridine diphosphate-glucuronosyltransferase 1 (UGT1) exon polymorphism sequences. The UGTs are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates including phenols, alcohols, amines and fatty acids. Many of the reactions catalysed by UGTs result in toxic substances being converted to compounds which are more water soluble and are excreted. The invention relates to and identifies UGT1 polymorphisms (AAZ45004-Z45041).

                                  The present invention relates to a novel Notch receptor ligand. The invention is useful for detecting Notch ligand expression in human cancer cells or melanoma cells. Also useful for enhancing angiogenesis in a mammal, useful when the mammal exhibits

                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                            The present invention describes a library of human polynucleotides comprising the sequences given in AAX12532 to AAX17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one cdifferentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one cof the 5248 polynucleotide sequences given in AAX12532 to AAX17779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, can be used for a variety of purpose, e.g. detection of expression levels, can be used for raising antibodies for experimental, diagnostic and comping, tissue typing or profiling, forensics, genetic analysis and construct can be used for raising antibodies for experimental, diagnostic and considered protein; and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to cancer). The polynucleotides or susceptibility to a disease such as cancer; The polynucleotides can also be used to screen for and lung cancer. The polynucleotides can also be used to screen for coptide analogues and annagement of colorectal cancer, breast cancer, cand lung cancer. The polynucleotides can also be used to screen for petide analogues and annagement of colorectal cancer.
                                                                                                                                                                                                            Query Match

The present sequence encodes a human bone morphogenetic protein-16 (C (BMP-16). Human BMP-16 is a homologue of a murine protein celled nodal, which is expressed in the mouse node during gastrulation. BMP-16 cDNA is consisted from a human genomic library screened with a probe derived from the nodal DNA sequence. The BMP-16 proteins can induce the formation of bone, cartilage or other connective tissue. They can be used for treating companies to the connective tissue defects, periodontal disease or healing of various types of tissues and wounds. They can also increase neuronal, astrocytic and glial cell survival and therefore be useful in curanglantation and treatment of conditions exhibiting a decrease in euronal survival and repair. They can also exhibit properties such as angiogenic, chemotactic and/or chemotatractant properties, and effects concells including induction of collagen synthesis, fibrosis, cold inferentiation responses, cell proliferative responses and responses convolving cell adhesion, migration and extracellular matrices. These corresponds the proteins potential agents for wound healing, correduction of fibrosis and reduction of scar tissue formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated bone morphogenetic protein-16 - used to develop products for inducing formation of bone, cartilage and other connective tissue, particularly for wound healing and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mat_peptide

                                                                                                                                                                                                                                                                                           therapeutically. Antibodies or other specific binding agents, are used to detect recombinant proteins and fragments of the Tango nucleotide sequence can be used as probes or primers for detecting the Tango gene, specifically mRNA, in usual hybridisation or amplification assays. These assays are used for diagnosis of diseases associated with abnormal expression of Tango proteins, e.g. detecting mutations in the Tango gene. Fragments of the Tango nucleic acid sequence are also used for genetic mapping and chromosome identification, and as antisense, ribozyme or triplex forming therapeutics. Antibodies may also be used to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the nucleotide sequence encoding the human Tango-78 protein used in the method of the invention. Host cells containing the Tango protein are used to produce recombinant proteins for raising antibodies. It is also used in identifying specific binding agents (including cognate receptors), which can be used to
                                                                                                                                                                                                                                                                                 anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding human Tango-78, -79 and -81 proteins - useful for diagnosis and treatment of Tango-associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                  determine amounts of recombinant protein in cells or

CC capacities including sexual development, pitultary hormone production, CC and the creation of bone and cartilage. The Nodal and Lefty polypeptides CC are useful for enhancing or enriching the growth and/or differentiation CC of specific cell populations, eg. embryonic cells or stem cells. They can be used to treat such conditions as osteoarthritis, osteoporosis, and CC other connective tissues and/or organs such as liver, lung, cardiac, CC pancreas, and kidney. Compositions containing nodal and lefty proteins CC may be useful for growth formation, for treating periodontal disease and CC for modulating haematopoiesis, wound healing and tissue repair. They can CC also be used for the treatment of tumours, cancers, interstitial lung CC disease, and any disregulation of the growth and differentiation patterns CC consuppression, immunity, authritis, leukaemia, lymphomas, CC immunosuppression, immunity, bumoral immunity, inflammatory bowel crepresents a DNA encoding a uponal polypeptide. The present sequence crepresents a DNA encoding, or infectious diseases. The present sequence crepresents a DNA encoding and under the ArCC decosit No. 209992 and/or
                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human nodal and lefty proteins which are members of the TGF-beta family. The human nodal and lefty proteins may be involved in a developmental process such as the correct formation of various structures or in one or more post-developmental

                                                                                                                                                                                                                                                                                           The present invention provides the protein and coding sequences for 43 novel human transport proteins (designated TPPTs). These can be used in the diagnosis and reatment of the ansport, metabolic, neurological, reproductive, Cardiyascular --- disorders, and real proliferations.

cc gynaecological, cardiant and antiinflammatory activities, and can be used cological, cardiant and antiinflammatory activities, and can be used color for diagnosing a pathological condition or a susceptibility to one in a cc subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cances antigens can be used to exponent the treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be used to design nucleic calci hybridisation probes that can proved in chromosome mapping, linkage and dispositic methods. The proteins can be used to design nucleic calci hybridisation probes that can proved in chromosome mapping, linkage and dispositic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including the proteins can be used to proteins can be used to protein can be used t

                                                                                                                                                                                                                                                                                                                                                                                                                                                            defects, periodontal disease or healing of various types of tissues and wounds. They can also increase neuronal, astrocytic and gilal cell survival and therefore be useful in transplantation and treatment of conditions exhibiting a decrease in neuronal survival and repair. They can also exhibit properties such as angiogenic, chemotactic and/or chemoattractant properties, and effects on cells including induction of collagen synthesis, fibrosis, differentiation responses, cell proliferative responses and responses involving cell adhesion, migration and extracellular matrices: These properties make the proteins potential agents for wound healing, reduction of fibrosis and reduction of scar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exon of the genomic DNA for human bone morphogenetic protein-16 (BMP-16). Human BMF-16 is a homologue of a murine protein celled modal, which is expressed in the mouse node during gastrulation. The BMP-16 proteins can induce the formation of bone, cartilage or other connective tissue. They

The cDNA is used to produce recombinant MGF in host cells, or as a probe. Transgenic animals, e.g. sheep, overexpressing MGF can be produced in order to increase milk producer to produce a therapeutically useful protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB B
